Definitions

Standard deviation	The standard deviation of an investment's returns is a measure of how much they can differ from its average return. It is a measure of risk and, as a result, volatility. Investors can use the standard deviation as a risk indicator to see how volatile their investments have been in the past. A higher standard deviation indicates that an investment is more variable or riskier. = √(Σ (Rp – Avg(Rp))² ÷ (n – 1) * √252
Sharp indicator	The Sharpe ratio is a tool that allows investors to compare the return on investment to the risk involved. This ratio is derived by subtracting the risk-free rate from the return of the portfolio and dividing the result by the investment's standard deviation. = Rp–Rf / σp
Tracking Error	Tracking error is a financial performance metric that evaluates the difference between an investment portfolio's return variations and the return fluctuations of a set benchmark. Standard deviations are the most common way to measure return variability. = σ(Rp–Rb) * √252
Beta	The volatility of a mutual fund in relation to its market benchmark is known as beta. = Cov(x, y) / Var(x)
Alpha	For a given level of risk, alpha is the excess return over the market benchmark. = R - [Rf + Beta * (Rm - Rf)]
Information Ratio	The information ratio demonstrates the fund manager's consistency in providing superior risk adjusted performance.
